Predictive performance

- True predictive performance is found out by using it to make predictions and comparing predictions to true observations
 - external validation

Predictive performance

- True predictive performance is found out by using it to make predictions and comparing predictions to true observations
 - external validation
- Expected predictive performance
 - approximates the external validation

Predictive performance

- We need to choose the utility/cost function
- Application specific utility/cost functions are important
 - eg. money, life years, quality adjusted life years, etc.

Predictive performance

- We need to choose the utility/cost function
- Application specific utility/cost functions are important
 - eg. money, life years, quality adjusted life years, etc.
- If are interested overall in the goodness of the predictive distribution, or we don't know (yet) the application specific utility, then good information theoretically justified choice is log-score

$$\log p(y^{\text{rep}}|y, M),$$

Outline

- What is cross-validation
 - Leave-one-out cross-validation (`elpd_loo`, `p_loo`)
 - Uncertainty in LOO (SE)
- When is cross-validation applicable?
 - data generating mechanisms and prediction tasks
 - leave-many-out cross-validation
- Fast cross-validation
 - PSIS and diagnostics in loo package (Pareto k , n_{eff} , Monte Carlo SE)
 - K-fold cross-validation
- Related methods (WAIC, \ast IC, BF)
- Model comparison and selection (`elpd_diff`, `se`)
- Model averaging with Bayesian stacking

Stan and `loo` package

Computed from 4000 by 20 log-likelihood matrix

	Estimate	SE
elpd_loo	-29.5	3.3
p_loo	2.7	1.0

Monte Carlo SE of elpd_loo is 0.1.

Pareto k diagnostic values:

		Count	Pct.	Min.	n_eff
(-Inf, 0.5]	(good)	18	90.0%	899	
(0.5, 0.7]	(ok)	2	10.0%	459	
(0.7, 1]	(bad)	0	0.0%	<NA>	
(1, Inf)	(very bad)	0	0.0%	<NA>	

All Pareto k estimates are ok ($k < 0.7$).
See `help('pareto-k-diagnostic')` for details.

Model comparison:

(negative 'elpd_diff' favors 1st model, positive favors 2nd)

elpd_diff	se
-0.2	0.1

True mean $y = a + bx$

True mean and sigma

Data

Posterior mean

Posterior mean, alternative data realisation

Posterior mean

Posterior draws

Posterior predictive distribution

Posterior predictive distribution

$$p(\tilde{y}|\tilde{x} = 18, x, y) = \int p(\tilde{y}|\tilde{x} = 18, \theta)p(\theta|x, y)d\theta$$

New data

Posterior predictive distribution

Leave-one-out mean

Leave-one-out residual

Leave-one-out residual

$$y_{18} - E[p(\tilde{y}|\tilde{x} = 18, x_{-18}, y_{-18})]$$

Leave-one-out residual

$$y_{18} - E[p(\tilde{y}|\tilde{x} = 18, x_{-18}, y_{-18})]$$

Can be used to compute, e.g., RMSE, R^2 , 90% error

Leave-one-out residual

$$y_{18} - E[p(\tilde{y}|\tilde{x} = 18, x_{-18}, y_{-18})]$$

Can be used to compute, e.g., RMSE, R^2 , 90% error

See LOO- R^2 at avehtari.github.io/bayes_R2/bayes_R2.html

Leave-one-out predictive distribution

Leave-one-out predictive distribution

$$p(\tilde{y}|\tilde{x} = 18, x_{-18}, y_{-18}) = \int p(\tilde{y}|\tilde{x} = 18, \theta)p(\theta|x_{-18}, y_{-18})d\theta$$

Posterior predictive density

Posterior predictive density

$$p(\tilde{y} = y_{18} | \tilde{x} = 18, x, y) \approx 0.07$$

Leave-one-out predictive density

$$p(\tilde{y} = y_{18} | \tilde{x} = 18, x, y) \approx 0.07$$

$$p(\tilde{y} = y_{18} | \tilde{x} = 18, x_{-18}, y_{-18}) \approx 0.03$$

Leave-one-out predictive densities

$$p(y_i|x_i, x_{-i}, y_{-i}), \quad i = 1, \dots, 20$$

Leave-one-out log predictive densities

$$\log p(y_i | x_i, x_{-i}, y_{-i}), \quad i = 1, \dots, 20$$

Leave-one-out log predictive densities

$$\sum_{i=1}^{20} \log p(y_i | x_i, x_{-i}, y_{-i}) \approx -29.5$$

Leave-one-out log predictive densities

$$\text{elpd_loo} = \sum_{i=1}^{20} \log p(y_i | x_i, x_{-i}, y_{-i}) \approx -29.5$$

Leave-one-out log predictive densities

$$\text{elpd_loo} = \sum_{i=1}^{20} \log p(y_i | x_i, x_{-i}, y_{-i}) \approx -29.5$$

unbiased estimate of log posterior pred. density for new data

Leave-one-out log predictive densities

$$\text{elpd_loo} = \sum_{i=1}^{20} \log p(y_i | x_i, x_{-i}, y_{-i}) \approx -29.5$$

$$\text{lpd} = \sum_{i=1}^{20} \log p(y_i | x_i, x, y) \approx -26.8$$

Leave-one-out log predictive densities

$$\text{elpd_loo} = \sum_{i=1}^{20} \log p(y_i | x_i, x_{-i}, y_{-i}) \approx -29.5$$

$$\text{lpd} = \sum_{i=1}^{20} \log p(y_i | x_i, x, y) \approx -26.8$$

$$\text{p_loo} = \text{lpd} - \text{elpd_loo} \approx 2.7$$

Leave-one-out log predictive densities

$$\text{elpd_loo} = \sum_{i=1}^{20} \log p(y_i | x_i, x_{-i}, y_{-i}) \approx -29.5$$

$$\text{SE} = \text{sd}(\log p(y_i | x_i, x_{-i}, y_{-i})) \cdot \sqrt{20} \approx 3.3$$

Leave-one-out log predictive densities

$$\text{elpd_loo} = \sum_{i=1}^{20} \log p(y_i | x_i, x_{-i}, y_{-i}) \approx -29.5$$

$$\text{SE} = \text{sd}(\log p(y_i | x_i, x_{-i}, y_{-i})) \cdot \sqrt{20} \approx 3.3$$

see Vehtari, Gelman & Gabry (2017a) and Vehtari & Ojanen (2012) for more

Fixed / designed x

LOO is ok for fixed / designed x . SE is uncertainty about $y|x$.

see [Vehtari & Ojanen \(2012\)](#) and andrewgelman.com/2018/08/03/loo-cross-validation-approaches-valid/

Distribution for x

LOO is ok for random x . SE is uncertainty about $y|x$ and x .

see [Vehtari & Ojanen \(2012\)](#) and andrewgelman.com/2018/08/03/loo-cross-validation-approaches-valid/

Distribution for x

LOO is ok for random x . SE is uncertainty about $y|x$ and x .
Covariate shift can be handled with importance weighting or modelling
see [Vehtari & Ojanen \(2012\)](#) and andrewgelman.com/2018/08/03/loo-cross-validation-approaches-valid/

loo package

Computed from 4000 by 20 log-likelihood matrix

	Estimate	SE
elpd_loo	-29.5	3.3
p_loo	2.7	1.0

Monte Carlo SE of elpd_loo is 0.1.

Pareto k diagnostic values:

		Count	Pct.	Min.	n_eff
(-Inf, 0.5]	(good)	18	90.0%	899	
(0.5, 0.7]	(ok)	2	10.0%	459	
(0.7, 1]	(bad)	0	0.0%	<NA>	
(1, Inf)	(very bad)	0	0.0%	<NA>	

All Pareto k estimates are ok ($k < 0.7$).
See `help('pareto-k-diagnostic')` for details.

Nonlinear model fit

Nonlinear model fit + new data

Nonlinear model fit + new data

Extrapolation is more difficult

Can LOO or other cross-validation be used with time series?

Leave-one-out cross-validation is ok for assessing conditional model

Leave-future-out cross-validation is better for predicting future

m-step-ahead cross-validation is better for predicting further future

m-step-ahead leave-a-block-out cross-validation

Rats data

Can LOO or other cross-validation be used with hierarchical data?

Leave-one-out?

Yes!

1-step-ahead?

Yes!

Leave-one-time-point-out?

Yes!

Leave-one-rat-out?

Yes!

Predict given initial weight?

Yes!

Summary of data generating mechanisms and prediction tasks

- You have to make some assumptions on data generating mechanism
- Use the knowledge of the prediction task if available
- Cross-validation can be used to analyse different parts, even if there is no clear prediction task

see [Vehtari & Ojanen \(2012\)](#) and andrewgelman.com/2018/08/03/loo-cross-validation-approaches-valid/

Fast cross-validation

- Pareto smoothed importance sampling LOO (PSIS-LOO)
- K-fold cross-validation

see [Vehtari, Gelman & Gabry \(2017a\)](#) and mc-stan.org/loo/

Data

Posterior draws

$$\theta^{(s)} \sim p(\theta|x, y)$$

Posterior predictive distribution

$$\theta^{(s)} \sim p(\theta|x, y), \quad p(\tilde{y}|\tilde{x}, x, y) \approx \frac{1}{S} \sum_{s=1}^S p(\tilde{y}|\tilde{x}, \theta^{(s)})$$

Posterior predictive distribution

$$\theta^{(s)} \sim p(\theta|x, y), \quad p(\tilde{y}|\tilde{x}, x, y) \approx \frac{1}{S} \sum_{s=1}^S p(\tilde{y}|\tilde{x}, \theta^{(s)})$$

PSIS-LOO weighted draws

$$\theta^{(s)} \sim p(\theta|x, y)$$

$$r_i^{(s)} = p(\theta^{(s)}|x_{-i}, y_{-i})/p(\theta^{(s)}|x, y)$$

PSIS-LOO weighted draws

$$\theta^{(s)} \sim p(\theta|x, y)$$

$$r_i^{(s)} = p(\theta^{(s)}|x_{-i}, y_{-i})/p(\theta^{(s)}|x, y) \propto 1/p(y_i|x_i, \theta^{(s)})$$

PSIS-LOO weighted draws

$$\theta^{(s)} \sim p(\theta|x, y)$$

$$r_i^{(s)} = p(\theta^{(s)}|x_{-i}, y_{-i})/p(\theta^{(s)}|x, y) \propto 1/p(y_i|x_i, \theta^{(s)})$$

$$\log(1/p(y_i|x_i, \theta^{(s)})) = -\log_lik[i]$$

PSIS-LOO weighted predictive distribution

$$\theta^{(s)} \sim p(\theta|x, y)$$

$$r_i^{(s)} = p(\theta^{(s)}|x_{-i}, y_{-i})/p(\theta^{(s)}|x, y) \propto 1/p(y_i|x_i, \theta^{(s)})$$

PSIS-LOO weighted predictive distribution

$$\theta^{(s)} \sim p(\theta|x, y)$$

$$r_i^{(s)} = p(\theta^{(s)}|x_{-i}, y_{-i})/p(\theta^{(s)}|x, y) \propto 1/p(y_i|x_i, \theta^{(s)})$$

$$p(y_i|x_i, x_{-i}, y_{-i}) \approx \sum_{s=1}^S [w_i^{(s)} p(y_i|x_i, \theta^{(s)})]$$

PSIS-LOO weighted predictive distribution

$$\theta^{(s)} \sim p(\theta|x, y)$$

$$r_i^{(s)} = p(\theta^{(s)}|x_{-i}, y_{-i})/p(\theta^{(s)}|x, y) \propto 1/p(y_i|x_i, \theta^{(s)})$$

$$p(y_i|x_i, x_{-i}, y_{-i}) \approx \sum_{s=1}^S [w_i^{(s)} p(y_i|x_i, \theta^{(s)})], \text{ where } w \leftarrow \text{PSIS}(r)$$

400 importance weights for leave-18th-out

4000 importance weights for leave-18th-out

4000 importance weights for leave-18th-out

see [Vehtari, Gelman & Gabry \(2017b\)](#)

4000 importance weights for leave-18th-out

$n_{\text{eff}} \approx 459$

Pareto $\hat{k} \approx 0.52$

- Pareto \hat{k} estimates the tail shape which determines the convergence rate of PSIS. Less than 0.7 is ok.

see [Vehtari, Gelman & Gabry \(2017b\)](#)

PSIS-LOO diagnostics

PSIS-LOO diagnostics

Pareto k diagnostic values:

		Count	Pct.	Min. n_eff
(-Inf, 0.5]	(good)	18	90.0%	899
(0.5, 0.7]	(ok)	2	10.0%	459
(0.7, 1]	(bad)	0	0.0%	<NA>
(1, Inf)	(very bad)	0	0.0%	<NA>

PSIS-LOO diagnostics

Pareto k diagnostic values:

		Count	Pct.	Min. n_{eff}
$(-\text{Inf}, 0.5]$	(good)	18	90.0%	899
$(0.5, 0.7]$	(ok)	2	10.0%	459
$(0.7, 1]$	(bad)	0	0.0%	<NA>

WAIC vs PSIS-LOO

see [Vehtari, Gelman & Gabry \(2017a\)](#)

WAIC vs PSIS-LOO

- WAIC has same assumptions as LOO

see [Vehtari, Gelman & Gabry \(2017a\)](#)

WAIC vs PSIS-LOO

- WAIC has same assumptions as LOO
- PSIS-LOO is more accurate

see [Vehtari, Gelman & Gabry \(2017a\)](#)

WAIC vs PSIS-LOO

- WAIC has same assumptions as LOO
- PSIS-LOO is more accurate
- PSIS-LOO has much better diagnostics

see [Vehtari, Gelman & Gabry \(2017a\)](#)

WAIC vs PSIS-LOO

- WAIC has same assumptions as LOO
- PSIS-LOO is more accurate
- PSIS-LOO has much better diagnostics
- LOO makes the prediction assumption more clear, which helps if K-fold-CV is needed instead

see [Vehtari, Gelman & Gabry \(2017a\)](#)

WAIC vs PSIS-LOO

- WAIC has same assumptions as LOO
- PSIS-LOO is more accurate
- PSIS-LOO has much better diagnostics
- LOO makes the prediction assumption more clear, which helps if K-fold-CV is needed instead
- Multiplying by -2 doesn't give any benefit (Watanabe didn't multiply by -2)

see [Vehtari, Gelman & Gabry \(2017a\)](#)

*IC

- AIC uses maximum likelihood estimate for prediction
- DIC uses posterior mean for prediction
- BIC is an approximation for marginal likelihood
- TIC, NIC, RIC, PIC, BPIC, QIC, AICc, ...

Marginal likelihood / Bayes factor

- Like leave-future-out 1-step-ahead corss-validation but starting with 0 observations

Marginal likelihood / Bayes factor

- Like leave-future-out 1-step-ahead corss-validation but starting with 0 observations

Marginal likelihood / Bayes factor

- Like leave-future-out 1-step-ahead cross-validation but starting with 0 observations
 - which makes it very sensitive to prior

Marginal likelihood / Bayes factor

- Like leave-future-out 1-step-ahead cross-validation but starting with 0 observations
 - which makes it very sensitive to prior and
 - unstable in case of misspecified models

Marginal likelihood / Bayes factor

- Like leave-future-out 1-step-ahead cross-validation but starting with 0 observations
 - which makes it very sensitive to prior and
 - unstable in case of misspecified models also asymptotically

Cross-validation for model assessment

- CV is good for model assessment when application specific utility/cost functions are used
 - e.g. 90% absolute error

Cross-validation for model assessment

- CV is good for model assessment when application specific utility/cost functions are used
 - e.g. 90% absolute error
- Also useful in model checking in similar way as posterior predictive checking (PPC)
 - model misspecification diagnostics (e.g. Pareto- k and p_{loo})
 - checking calibration of leave-one-out predictive posteriors (`ppc_loo_pit` in `bayesplot`)

see demos avehtari.github.io/modelselection/

Radon example

PSIS-LOO diagnostics

see [Vehtari, Gelman & Gabry \(2017a\)](#)

Sometimes cross-validation is not needed

Sometimes cross-validation is not needed

- Posterior predictive checking is often sufficient

Predicting the yields of mesquite bushes.

Gelman, Hill & Vehtari (2020): Regression and Other Stories, Chapter 11.

Sometimes cross-validation is not needed

- Posterior predictive checking is often sufficient

Predicting the yields of mesquite bushes.

Gelman, Hill & Vehtari (2020): Regression and Other Stories, Chapter 11.

- BDA3, Chapter 6
- Gabry, Simpson, Vehtari, Betancourt, Gelman (2019). Visualization in Bayesian workflow. JRSS A, <https://doi.org/10.1111/rssa.12378>

- betanalpha.github.io/assets/case_studies/principled_bayesian_workflow.html

Arsenic well example – Model comparison

- Probability of switching well with high arsenic level in rural Bangladesh
 - Model 1 covariates: $\log(\text{arsenic})$ and distance
 - Model 2 covariates: $\log(\text{arsenic})$, distance and education level

Gelman, Hill & Vehtari (2020): Regression and Other Stories, Chapter 13.

Arsenic well example – Model comparison

Model 1 elpd_loo \approx -1952, SE=16

Model 2 elpd_loo \approx -1938, SE=17

Arsenic well example – Model comparison

Model 1 vs Model 2

```
> loo_compare(model1, model2)
      elpd_diff se_diff
model2    0.0     0.0
model1 -14.4     6.1
```

see Vehtari, Gelman & Gabry (2017a)

Arsenic well example – Model comparison

```
> loo_compare(model1, model2)
      elpd_diff se_diff
model2    0.0     0.0
model1 -14.4     6.1
```

`se_diff` and normal approximation for the uncertainty in the difference is good only if models are well specified and the number of observations is relatively big (more details in a forthcoming article).

Sometimes cross-validation is not needed

- For some very simple cases you may assume that true model is included in the list of models considered (M -closed)

Sometimes cross-validation is not needed

- For some very simple cases you may assume that true model is included in the list of models considered (M -closed)
 - see predictive model selection in M -closed case by San Martini and Spezzaferri (1984)

Sometimes cross-validation is not needed

- For some very simple cases you may assume that true model is included in the list of models considered (M -closed)
 - see predictive model selection in M -closed case by San Martini and Spezzaferri (1984)
 - but you should not force your design of experiment or analysis to stay in the simplified world

Sometimes cross-validation is not needed

- For some very simple cases you may assume that true model is included in the list of models considered (M -closed)
 - see predictive model selection in M -closed case by San Martini and Spezzaferri (1984)
 - but you should not force your design of experiment or analysis to stay in the simplified world
- In nested case, often easier and more accurate to analyse posterior distribution of more complex model directly
avehtari.github.io/modelselection/betablockers.html

Model averaging

- Prefer continuous model expansion

Model averaging

- Prefer continuous model expansion
- If needed integrate over the model space = model averaging

Model averaging

- Prefer continuous model expansion
- If needed integrate over the model space = model averaging
- Bayesian stacking may work better than BMA
 - Yao, Vehtari, Simpson, & Gelman (2018)

Cross-validation and model selection

- Cross-validation can be used for model selection if
 - small number of models
 - the difference between models is clear

Cross-validation and model selection

- Cross-validation can be used for model selection if
 - small number of models
 - the difference between models is clear
- Do not use cross-validation to choose from a large set of models
 - selection process leads to overfitting

Cross-validation and model selection

- Cross-validation can be used for model selection if
 - small number of models
 - the difference between models is clear
- Do not use cross-validation to choose from a large set of models
 - selection process leads to overfitting
- Overfitting in selection process is not unique for cross-validation

Selection induced bias and overfitting

- Selection induced bias in cross-validation
 - same data is used to assess the performance and make the selection
 - the selected model fits more to the data
 - the CV estimate for the selected model is biased
 - recognised already, e.g., by Stone (1974)

Selection induced bias and overfitting

- Selection induced bias in cross-validation
 - same data is used to assess the performance and make the selection
 - the selected model fits more to the data
 - the CV estimate for the selected model is biased
 - recognised already, e.g., by Stone (1974)
- Performance of the selection process itself can be assessed using two level cross-validation, but it does not help choosing better models

Selection induced bias and overfitting

- Selection induced bias in cross-validation
 - same data is used to assess the performance and make the selection
 - the selected model fits more to the data
 - the CV estimate for the selected model is biased
 - recognised already, e.g., by Stone (1974)
- Performance of the selection process itself can be assessed using two level cross-validation, but it does not help choosing better models
- Bigger problem if there is a large number of models as in covariate selection

Selection induced bias in variable selection

Selection induced bias in variable selection

Piironen & Vehtari (2017)

Take-home messages

- It's good to think predictions of observables, because observables are the only ones we can observe
- Cross-validation can simulate predicting and observing new data
- Cross-validation is good if you don't trust your model
- Different variants of cross-validation are useful in different scenarios
- Cross-validation has high variance, and **if** you trust your model you can beat cross-validation in accuracy
